Osteoprotegerin ligand is a cytokine that regulates osteoclast
differentiation and activation
Cell 93 (2), 165-176 (1998)
                                                                                                                                                                                                                                                                                                                                                                                                                                              /product="osteoprotegerin ligand"

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

treat conditions ე Surface antigen, 49969 process with abnormal physiology or development Mouse cell associated

Claim 4; Pages 8-11; 59pp; Englis 1.

abnormal physiology or development. The 4999 protein is expressed highly on polarised ThI T cells, binding of 4999 protein is expressed highly on polarised ThI T cells, binding of 4999 protein is expressed highly on polarised ThI T cells, binding of 4999 protein is expensed to modulate immune responses in abnormal situations, e.g. autoimmune disorders including rheumatoid arthritis, systemic lupus erythematosus, Hashimoto's rutoimmune thyroiditis, as well as acute inflammatory responses in which T-cell expansion, activation or immunological T-cell memory play in important role. The antibodies can be used to raise anti-idiotype antibodies which will be useful to the expression of antigens of 4999. The antibodies, and fragments of 4999 can be used in the treatmen: of conditions associated with abnormal physiology or development, including abnormal proliferation (e.g. cancerous conditions) or developmentive conditions. is is the nucleotide sequence encoding the mouse 499E9 protein, the method of the invention to treat conditions associated with in

The present sequence encodes human osteoprotegerin (OPG) binding profein. Host cells transfected with vectors containing nucleic acid molecules encoding OPG binding protein are used to produce recombinant OPG binding protein are used to produce recombinant OPG binding protein is used in binding assays to determine osteoprotegrin (OG) in biological samples; to screen for specific binding agents (particularly agonists and antagonists, including intracellular proteins); to raise Ab (useful in immunoassays for detection of OPG binding protein to osteoclast differentiation and and and to identify compounds that modulate binding of OPG binding protein to osteoclast differentiation binding protein can be used to detect OPG binding protein-encoding sequences, e.g. screening for related sequences, also to produce transgenic animal models, while complementary sequences are used for continuous animal models, while complementary sequences are used for thistics animal models, while complementary sequences are used for online animal models, while complementary sequences are used for online animal models.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               OPG binding protein, particularly soluble forms of OPG binding protein or Ab, are used to treat or prevent bone diseases, e.g. osteoporosis, bone loss caused by arthritis or metastases, hypercalcaemia, Paget's disease, periodontal disease, osteoporosis, loosening of prostheses,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TGGTGGCCGAGGAAGGAAGGATCGCGGAGCAGGGCGCCCGAACTCCGGGCGCCC 120

> It is not capable of inducing osteoclast differentiation in the absence of CSF-I. OPGL is also an activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of OPGL activity in an animal. The method comprises using at least one OPGL anolypeptide or subsequence, and/or at least one OPGL analogue to induce an immune response in the animal. The method and OPGL polypeptide are useful for treating, preventing and ameliorating osteoporosis or other OPGL a potent osteoclast differentiation factor when combined with CSF-1. nseq The present sequence encodes a murine osteoprotegerin ligand (OPGL). Osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II transmembrane protein. The murine and human OPGL polypeptides are 87% homologous. O for treating, preventing and ameliorating osteoporosis or c s or conditions characterised by excessive bone resorption. (OPGL) activity on of osteoprotegerin ligand ameliorate osteoporosis -110pp; English down-requlation treat, prevent and Page Disclosure; diseases 2

Agonists and antagonists of TRANEE, can be used to modulate immune response by increasing or decreasing the life span of mature dendritic cells and increasing or decreasing T cell activation. These techniques are especially useful for treating immune system related conditions such as HIV, cancer, autoimmune disease or hypersensitivity to an allergen. The TRANCE polypeptides can be used to increase the viability of dendritic cells in vivo or in vitro, especially when used in conjunction with proteins of the tumour necrosis factor (TNF) superfamily (especially CD40L or TNF-alpha).
cokines (TRANCE). Human or murine TRANCE polypeptides or their lants, fragments, derivatives or analogues may be used as modulators immune response in a mammal comprising, antisense sequences to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This cDNA encodes a murine RANKL, a ligand for the RANK (receptor activator of necrosis factor-kappaB (NF-kB)) polypeptide. RANK is a member of the tumour necrosis factor (TNF) family. A soluble RANK is a may be used for inhibiting activation of NF-kB, by contacting a cell expressing membrane-associated RANK with a soluble RANK which binds t

RANK ligand (RANKL). RANKL polypelytides can activate RANK and can be used to induce maturation of dend:itic cells and enhance their allo-stimulatory capacity, thereb: augmenting an immune response. The soluble RANK polypeptide composition may also be used for requiating an immune or inflammatory response. Inhibition of NF-kB by RANK antagonists may be useful in ameliorating negitive effects of an inflammatory response that result from trigger:ing of RANK, e.g. in treating toxic shock or sepsis, graft-versus-hos: reactions, or acute inflammatory cactions. They can also be used in adjunct therapy for disease characterised by neoplastic cells that express RANK. RANKL polypeptides can also be used to identify inhilitors of RANK and thus inhibitors of an inflammatory response, and also for protecting RANK expressing cells from the negative effects of chemichterapy or the presence of high levels of TANK and TANK and also the used for detection and drug

This cDNA encodes a murine RANKL, a ligand for the RANK (receptor activator of necrosis factor kappaB (NF-kB)) polypeptide. RANK is a member of the tumour necrosis factor (TF) family. Host cells transformed or transfected with an expression vector comprising the RANK encoding nucleic acid can be used to produce recombinant RANK protein. The soluble RANK may be used for inhibiting activation of NF-kB, by contacting a cell expressing membrane-associated RANK with a soluble RANK which binds to RANK ligand (RANKL). The soluble RANK wolly a soluble RANK which binds to used for regulating an immune or inflammatory response. Inhibition of NF-kB by RANK antagonists may be useful in ameliorating negative effects of an inflammatory response that result from triggering of RANK, e.g. in Inflammatory reactions. They can also be used in adjunct therapy for disease characterised by neophastic cells that express RANK. The products can also be used in adjunct therapy for disease characterised by neophastic cells that express RANK. The products

absorption factors such as calcitriol or parathyroid hormone (PTH).

OBM is isolated from stroma cells cultured in the presence of a bone absorption factor by separation and solubilisation of membrane proteins then affinity chromatography using OCIF. It exists in a full-sequence form and a solubilised form (sOBM) which is a shorter chain. OBM may be used for screening potential inhibitors and modifiers of its biological activity, and screening for receptors to OBM which mediate its function. These substances can then be used in the treatment of disorders of bone function and calcium metabolism. The antibodies can be used for assay of the protein, for investigative and diagnostic purposes, and as
                                                                                                                                                                                                                                                                                                                                                            240

The present sequence encodes a human osteoprotegerin ligand (OPGL). Osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II transmembrane protein. The murine and human OPGL polypeptides are 87% homologous. OPGL is a potent osteoclast differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence CSF-1. OPGL is also an activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of OPGL activity in an animal. The method comprises using at least one OPGL polypeptide or subsequence, and/or at least one OPGL analogue to induce in immune response in the animal. The method and OPGL polypeptide are useful for treating, preventing and ameliorating osteoporosis or other diseases or conditions characterised by excessive bone resorption.

Host cells transfected with vectors containing nucleic acid molecules encoding OPC binding protein are used to produce recombinant OPC binding protein. OPC binding protein is used in binding assays to determine osteoprotegrin (OG) in biological samples; to screen for specific binding agents (particularly agonists and antagonists, including intracellular proteins); to raise Ab (useful in immunoassays for detection of OPG binding protein and to identify compounds that modulate binding of OPG binding protein to osteoclast differentiation and activation receptor (ODAR). The nucleic acid molecule encoding open binding protein can be used to detect OPC binding protein-encoding sequences, e.g. screening for related sequences, also to produce transgenic animal models, while complementary sequences are used for antisense regulation of OPG binding protein expression. Modulators of present sequence encodes human osteoprotegerin (OPG) binding protein. binding protein, particularly soluble forms of OPG binding protein Ab, are used to treat or prevent bone diseases, e.g. osteoporosis, e loss caused by arthritis or metastases, hypercalcaemia, Paget's asse, periodontal disease, osteoporosis, lossening of prostheses, Nucleic acid encoding osteoprotegrin binding protein – useful for, e.g. treating bone diseases by modulating osteoclast differentiation optionally in combination with agents that promote bone growth.                                                                                                                                                                                                                                                                                             The present sequence encodes human TNF-related activation induced cytokines (TRANCE). Human or murine TRANCE polypeptides or their variants, fragments, derivatives or analogues may be used as modulators of immune response in a mammal comprising, antisense sequences to TRANCE and fusion proteins comprising human and/or murine TRANCE. Agonists and antagonists of TRANCE, can be used to modulate immune response by increasing or decreasing the life span of mature dendritic calls and increasing or decreasing T cell activation. These techniques are especially useful for treating immune system related conditions such as HIV, cancer, autoimmune disease or hypersensitivity to an allergen. The TRANCE polypeptides can be used to increase the viability of dendritic cells in vivo or in vitro, especially when used in conjunction with proteins of the tumour necrosis factor (TNF) superfamily (especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence appears in the specification, which describes an osteoclastogenesis inhibitory factor (OCIF)-binding molecule (OBM). The protein promotes and supports the separation and maturation of osteoclasts in the presence of bone absorption factors such as calcittiol or parathyroid hormone (PTH). OBM is isolated from stroma cells cultured in the presence of a bone absorption factor by separation and solubilisation of membrane proteins then affinity chromatography using OCIF. It exists in a full-sequence form and a solubilised form (SOBM) which is a shorter chain. OBM may be used for screening potential inhibitors and modifiers of its biological

Osteoprotegerin is a secreted member of the tumour necrosis factor. Teceptor family, which blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II transmembrane protein. The mutine and human OPGL polypeptides are 87% homologous. OPGL is a potent osteoclast differentiation factor when combined with CSF-I. It is not capable of inducing osteoclast differentiation in the absence of CSF-I. OPGL is also an activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         OPGL activity in an animal. The method comprises using at least one OPGI polypeptide or subsequence, and/or at least one OPGL analogue to induce an immune response in the animal. The method and OPGL polypeptide are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of osteoprotegerin ligand (OPGL) activity used

                                                                                                                                                                                                                                                                                                                                                                                          õ
                                                                                                                                                                                                                                                                                                                                                                                                       q
```

```
This sequence encodes the osteoclast formation promoting factor (OBM). The invention relates to an OBM binding protein (OBM-BP). The protein is useful as a preventive and/or treating agent for bone metabolic diseases such as osteoporosis. Substances which inhibit the binding of OBM to OBM-BP can be used as biochemical reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                       184

The present sequence encodes an osteoclastogenesis inhibitory factor (OCIF) binding molecule (OBM). The protein promotes and supports the separation and maturation of osteoclasts in the presence of bone absorption factors such as calcitriol. or parathyroid hormone (PTH). OBM is isolated from stroma cells cultured in the presence of a bone absorption factor by separation and solubilisation of membrane proteins then affinity chromatography using OCIF. It exists in a full-sequence form and a solubilised form (SOBM) which is a shorter chain. OBM may be used for screening potential inhibitors and modifiers of its biological
                                                                                                                                                                    activity, and screening for receptors to OBM which mediate its function. These substances can then be used in the treatment of disorders of bone function and calcium metabolism. The antibodies can be used for assay of the protein, for investigative and diagnostic purposes, and as components of drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1000
